

Nexora Insight Platform — Product Datasheet

Overview

The Nexora Insight Platform is the flagship product of Nexora Analytics, an enterprise AI company founded by Maria Chen in 2021. The platform provides real-time analytics and disruption forecasting for supply chain and logistics operators.

Architecture

The Nexora Insight Platform combines streaming data ingestion with a hybrid retrieval architecture that blends vector search, keyword search, and graph traversal. This architecture was designed under the direction of David Okoro, Chief Technology Officer of Nexora Analytics.

The platform ingests data from over 40 supported logistics data sources, including GPS telemetry feeds, customs filings, and weather disruption APIs.

Deployment

The Nexora Insight Platform launched publicly in June 2022. A major architecture upgrade, internally called Project Meridian, shipped in August 2024, adding multi-modal retrieval support for image-based cargo inspection reports.

Customers

As of January 2025, the Nexora Insight Platform is used by over 120 enterprise customers, including three Fortune 500 logistics companies. Reference customers include Falcon Freight and Meridian Shipping Co.

Competitive Landscape

The Nexora Insight Platform competes with products from Fathom Systems and Ledger Grid. Nexora Analytics' internal positioning emphasizes real-time graph-based retrieval as its key differentiator against competitors' batch-processing approaches.
